

Introduction to Full Stack Development & Web Architecture (MERN Overview)

1. Client (Browser)

- Users access the application via browser.
- Examples include Google Chrome, Mozilla Firefox, or Microsoft Edge.
- Sends requests to the server and displays responses.
- Receives and renders responses (HTML, CSS, JavaScript)

2. Frontend (UI Layer)

- Renders UI and handles user interactions.
- Built using technologies like HTML, CSS, and JavaScript
- Sends API requests to the backend and displays data.

3. Backend (Server)

- Exposes APIs for the frontend.
- Contains business logic, authentication, validation, etc.
- Communicates with the database.

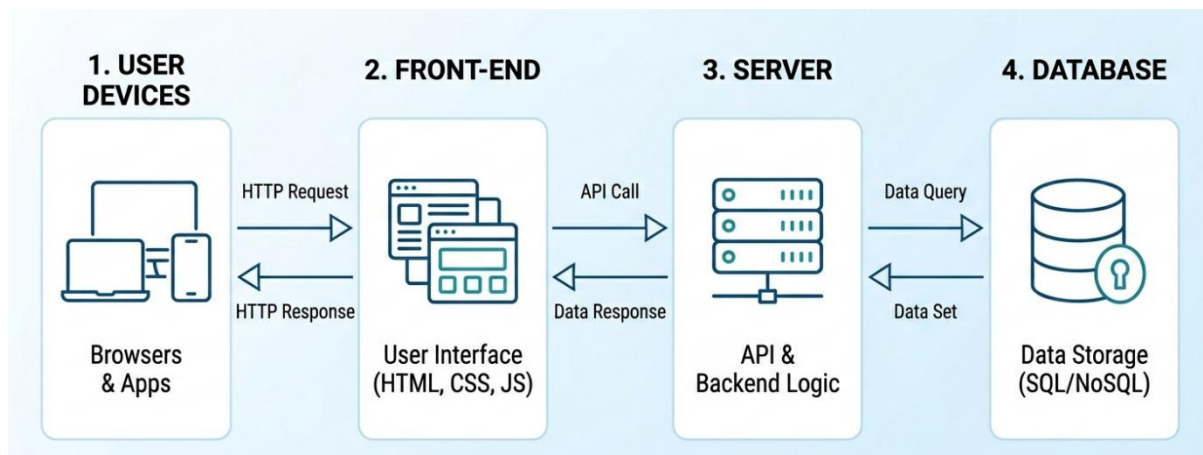

4. Database (MongoDB – Conceptual)

- Stores application data.
- Returns data in response to backend queries.
- MongoDB is a NoSQL database that stores data in flexible, JSON-like documents

Simple Flow (How they work together):

1. User clicks a button in the browser (Client)
2. Frontend sends a request to the Backend
3. Backend processes it and may query the Database
4. Database returns data to Backend
5. Backend sends response to Frontend
6. Frontend updates what the user sees
